CRITICAL SECURITY FLAWS

CRITICAL / HIGH PRIORITY

CSP Not Implemented

No Content Security Policy found. High risk of XSS and data injection attacks.

Weak Cipher Suites (TLS 1.2)

Server supports outdated TLS 1.2 ciphers vulnerable to modern decryption techniques.

Broken Profile Redirects

Twitter and LinkedIn profile links are inactive or misconfigured, leading to dead ends.

WhatsApp Integration Failure

The WhatsApp contact trigger is broken and does not initiate a chat session.

Static Form / No Database

Contact form is static. Data is not saved to any backend database upon submission.

01
10

Missing Form Validation

Input fields accept special symbols and malformed data. Crucial security risk for form injection.

Render Blocking Network Chain

Synchronous requests are delaying the Largest Contentful Paint (LCP) significantly.

COMPLIANCE & HEALTH

MEDIUM PRIORITY

DMARC Policy: p=none

Current DMARC configuration offers no protection against email domain spoofing.

SPF Policy Too Permissive

SPF record uses (~all) which allows unauthorized servers to send mail on your behalf.

DNSSEC Not Enabled (Audit 1)

Missing DNS security extensions, making the site vulnerable to DNS poisoning.

HSTS Preload List Missing

Domain is not pre-registered for HTTPS-only access in browser internal caches.

Missing Gzip Compression

Assets are delivered uncompressed, increasing download times and server bandwidth.

Missing Expires Headers

Static assets are not cached locally in users' browsers for subsequent visits.

Deep Request Chaining

The network dependency tree has excessively long chains, slowing down page completion.

HARDENING

LOW PRIORITY

X-Frame-Options Insecure

Frame protection is not strict, allowing potential UI redressing or clickjacking.
